

Recall commits (changes) to a repo

Today: Method for organizing individual commits called branches (trees)

Master branch is what you see by default on GitHub.

Steps to add a feature to repo for which you are an internal collaborator

- ① Create a new branch
- ② Pull locally to bring in new branch & switch to this new branch
- ③ Add many commits to new branch
- ④ Make a pull request PR:
a request to pull in commits in new branch into master

After code review we then accept PR and merge new branch into master.
